This week I am responsible creating a configuration file for the application. The configuration file will be a JSON file. When trying to learn the code base I would try to improve readability or add getters/setter functions. Trying to refactor and improve the function/readability then when I found it adds to my overall understanding of the code. This is code refactor is now in the Review Work column in our KanBan board.

To incorporate OOP design when writing code, I would try to limit the number of IF statements, for in OOP one can reduce the number of If statements using inheritance and polymorphism. By reducing the number of IF statements it allows the reader of the code to lessen the cognitive load.

I am happy that Mitchel really has a strong grasp on Android development and that Chang, although had a few technical problems with his git environment, really ramped up quickly and already have a feature written, tested, and is now pulled in our working code base.
